Geometry: Circles: Study Guide | SparkNotes

We define a diameter, chord and arc of a circle as follows: L The distance across a circle through the centre is called the diameter. Thus, the diameter of a circle is twice as long as the radius. L A chord of a circle is a line that connects two points on a circle. L An arc is a part of a circle.

A circle is the set of all points equidistant from a given point. The point from which all the points on a circle are equidistant is called the center of the circle, and the distance from that point to the circle is called the radius of the circle. A circle is named with a single letter, its center. See the diagram below.

Let's look at the definition of a circle and its parts. We will also examine the relationship between the circle and the plane. A circle is a shape with all points the same distance from its center. A circle is named by its center. Thus, the circle to the right is called circle A since its center is at point A. Some real

A circle is the same as 360°. You can divide a circle into smaller portions. A part of a circle is called an arc and an arc is named according to its angle. Arcs are divided into minor arcs (0° < v < 180°), major arcs (180° < v < 360°) and semicircles (v = 180°).

A circle is formed from the infinite number of points equidistant (the same distance) from a single point--the center of the circle. A circle is also a two dimensional shape, which means it is completely flat. So any and all straight lines drawn from the center will exactly hit the edge of the circle as long as all the lines are of equal length.
