Phototropism Grade 12 Practical Hypothesis Testing Phototropism Grade 12

Plants also move toward the light. Seeds push little leaves up from the ground into the light. A house plant in a dark room will grow toward the light. This movement in response to light is called phototropism. When a plant moves

Testing

toward the light, it's called positive tropism.

When a plant moves away from light, it's called negative tropism.

the plants that are in the shade. Hypothesis: Phototropism Virtual Lab The hypothesis provided for this experiment is that the seedling meristem are affected by light and bend towards the light source that is provided. The hypothesis will be tested by using a positive control, a negative control, and experimental control.

A group of Grade 12 learners wanted to investigate the effect of light coming from one direction on the growth of shoots. They planted some wheat seeds in two seed trays and allowed it to germinate. When young shoots appeared above the soil level, the shoots were exposed to light from

Phototropism -

Tropisms are a plant's reaction to something. Phototropism is a plant's reaction to light. The cause of phototropism is an auxin. Auxin is a hormone that tells the side of the plant with the most shade to grow longer than the other side. This causes the plant to bend
