We see that the output of the FFT is a 1D array of the same shape as the input, containing complex values. All values are zero, except for two entries.

Traditionally, we visualize the magnitude of the result as a stem plot, in which the height of each stem corresponds to the underlying value. (We explain why you see positive and negative frequencies later on in “Discrete Fourier Transforms”).

In probability theory, a normal (or Gaussian or Gauss or Laplace–Gauss) distribution is a type of continuous probability distribution for a real-valued random variable. The general form of its probability density function is  $f(x) = \frac{1}{\sigma\sqrt{2\pi}} e^{-\frac{(x-\mu)^2}{2\sigma^2}}$  where  $\mu$  is the mean or expectation of the distribution (and also its median and mode), while the parameter  $\sigma$  is its standard deviation.

The solution of the equations in probability models yields the probabilities of outcomes and events as well as various types of averages. • The probabilities and averages for a random experiment can be found experimentally by computing relative frequencies and sample averages in a large number of repetitions of a random experiment.
