Clinical pharmacokinetics is the application of pharmacokinetic principles to the safe and effective therapeutic management of drugs in an individual patient. Primary goals of clinical pharmacokinetics include enhancing efficacy and decreasing toxicity of a patient's drug therapy.

Introduction to Pharmacokinetics and Pharmacodynamics

Pharmacokinetic changes include a reduction in renal and hepatic clearance and an increase in volume of distribution of lipid soluble drugs (hence prolongation of elimination half-life) whereas pharmacodynamic changes involve altered (usually increased) sensitivity to several classes of drugs such as anticoagulants, cardiovascular and psychotropic drugs.

Age-related changes in pharmacokinetics and ...

The first 3 Chapters cover general principles and pharmacokinetic and pharmacodynamic concepts. The 4th Chapter discusses modeling strategies and ends with a checklist for assessing goodness-of-fit for models. Chapter 5 discusses elements of design for kinetic and dynamic studies and what data and design are needed to answer specific questions.

The course will provide participants with a comprehensive overview of pharmacokinetics by integrating concepts in physiology and mathematics. At the end of this seminar, attendees will understand fundamental pharmacokinetic concepts and be able to use them to design pharmacokinetic studies, compute pharmacokinetic parameters, and predict the effect of physiological and formulation changes on ...

Pharmacokinetics: A Comprehensive Overview of Principles ...

Edited by Tarek A Ahmed This book considers the basic principles of biopharmaceutics and pharmacokinetics. It also illustrates clinical pharmacokinetic applications, such as recirculatory models, common antimalarial drugs, and clinical pharmacokinetic principles in critically ill patients, which are essential for medical professionals.

Basic Pharmacokinetic Concepts and Some Clinical Applications

Pharmacokinetic and pharmacodynamic principles should be regarded in the assessment and proper management of patients exposed to a poison. Clinicians must apply these principles to make rational clinical decisions regarding the significance of the poisoning (risk assessment) and to formulate an appropriate management plan.

Pharmacodynamics (PDs) is the science of drug action on the body or on microorganisms and other parasites within or on the body. It may be studied at many organizational levels - sub-molecular, molecular, cellular, tissue/organ and whole body - using in vivo, ex vivo and in vitro methods and utilizing a wide range of techniques.
