Even though, the server is configured with PHP-FPM 54, we can modify the PHP-FPM instances for the individual domains via cPanel. I'll explain you on how to modify the PHP-FPM instances for individual domains via cPanel using some screenshots. The installation of Nginx plugin will provide you with an icon of Nginx Webstack in your domain's cPanel.

Apache Php Fpm

## **Stack Overflow**

Apache and Nginx are two popular open source web servers often used with PHP. It can be useful to run both of them on the same virtual machine when hosting multiple websites which have varied requirements. The general solution for running two web servers on a single system is to either use multiple IP addresses or different port

In step 6, we explain why we use PHP-FPM running on port 9000. Setting up a TCP port is much easier when using multiple PHP backends, switching from Apache to NGINX, or PHP-FPM versus HHVM. In step 7, we add an Apache module that acts as a proxy, so we are able to connect PHP-FPM to Apache.

Nginx is an Apache alternative web server in the open source category to support

several internet protocols such as HTTP (S), IMAP, and POP3. It

can also be used as a reverse proxy with WebSocket support.

The server offers a gunzip module, whereby compressed web pages can be unpacked before being sent to the browser.
